⇒ Translaⁿ Problem
(Tamil → English)

- Decision Lists – simple rule-based classificaⁿ in ML. A decision list is an ordered list of if-then rules.

- When you have map, then you don't have to learn it, then there is no req. of bottom's-up approach to solve that problem → just a generative model.

- piece vs peace → identifying candidates will not works
homophones (they sound the same)

Estimate $\boxed{P(w_i \mid c_{-k} \dots c_k)} \propto P(c_k \dots \mid w_i) \cdot P(w_i)$ → priors

which we have to learn { one set of params ← ; other set ←

2 types of content
-> content words → surrounding words around a target word in a sentence
→ collocations → words that frequently occur together in a lang.

- while we see the w_i, the content words around w_i, cannot be considered as content.

- Brown corpus → a structured collecⁿ of eng texts from diff. sources, used for lang. analysis.

__/__/____

- hard problem of calculating priors & likelihoods, also problem of identifying the candidates.
- currently we have the assumption all the words around w_i are all actually having correct spellings. Otherwise, there'll be nasty circular problems.
- Circularity (interdependency) is crucial for our problem.
- difference btw. test-train split & cross-valida^n → for evaluations
  - → train data, used to train the params
  - → to make sure your train data does not just overfit the model.
- Theories → lang. is not self-sufficient, lang. is just a way to fulfill partial things coming from your heart.
- Perceptual grounding problem of AI - challenge of connected words, symbols or concepts inside a comp. to real-world sensory experiences.

- More you know, more you become silent abt. the same.
