Candidate Generation

↳ based on priors $\left(\frac{n_c}{N}\right)$

n_c → no. of tokens corresponding to type c

N → total no. of tokens in collec^{n}

- candidate correc^{ns}
  ↳ deletion, insertion, transposi^{n}, substitu^{n}

- estimate $p(t \mid c)$
  ↓
  evaluate candidates

this is done based on domain, evalua^{n}, assump^{ns}, source of knowledge
