⇒ IR (Informaⁿ Retrieval)

↳ get the relevant, collecⁿ of documents
notions

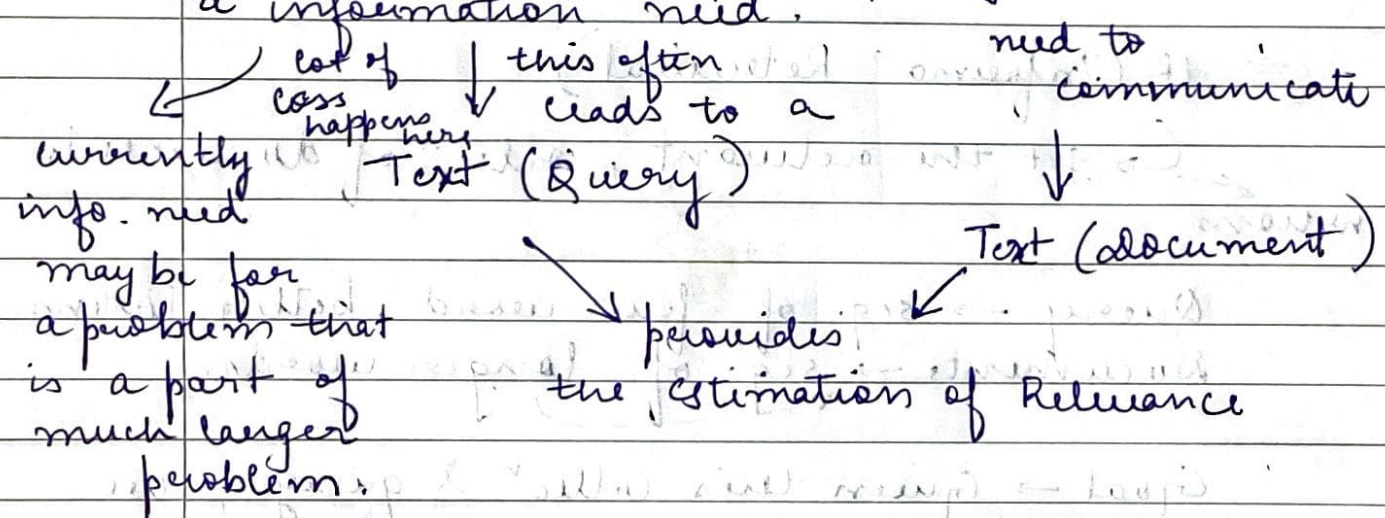

Query → seq. of few worded, better tokens
Documents → seq. of longer words.

Goal → Given this collecⁿ & query, we have to get relevant documents.

- lexical → word, word unit
 - discourse → paragraphs, diff. levels of (pronouns) problem originating
 - compositional → sentence level (syntax, parsing)
- they all come under the building blocks problem.

- these building blocks problems have to be solved before you can solving applicaⁿ
- Applicat^{ns} → QA, MT, summarizaⁿ, IR
- When I am writing a query, there is a information need.

- Perceived info. need - sometimes we just feel like having an info., but it is actually not needed.
- IR → can be multi-model. But currently we have are referring to is text! That too, specially unstructured text.
- Jeffery Hinton -

- Structured text → we have clarity over what kind of operations can be performed on them.

- Text vs Speech → which is harder?

↓
when you start here, brain → text mapping the mental model into language.

- we now have to compare two pieces of text together.
